Design Ideas and Concepts and how they were applied to our work-in-progress website:

1. Affordances

- Buttons/links are underlined, highlighted or change colour when hovered over making it clear that they are clickable.
- Selectable sections like the three main programs on our front page are also highlighted when hovered over

2. Signifiers

- Buttons use obvious wording to signify that the user can interact with them and click them.

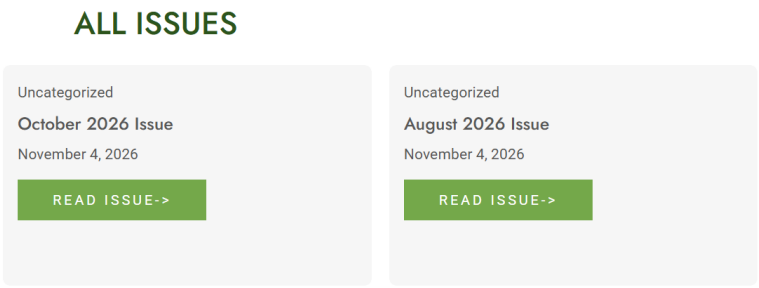

- We used images and labelled sections to clearly distinguish between different content areas and understand the purpose of each section.

3. Gestalt Principles

- Proximity: Related elements like programs are positioned close together and organized into a distinct section on the homepage.

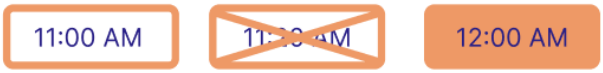

- Similarity and Symmetry: The Pollinator Archive uses equally spaced and designed containers to have a clear, understandable and organized layout. This consistent design makes it clear that each box has its own purpose while also contributing to a cohesive visual design.

4. Constraints

- While not currently present at the moment because of WordPress struggles, the repair cafe page will for sure have crossed out days and times in which the user cannot select. See Figma prototype here:

- A concept we used in relationship to constraints is keeping the website very simple and easy to use to restrict the user from getting lost as much as possible.
